MyData Architecture Framework Service Descriptions Specification

v. 2.0

1. Introduction

- 1.1 Notational Conventions
- 1.2 Terminology
- 1.3 Formats
- 2. Service Description
 - 2.1 Common Service Description
 - 2.2 Data Description
 - 2.3 Processing Description
 - 2.5 Notification Description
- 3. Operator Configuration
 - 3.1 Operator Description
- 4. Deployment Options
- 5. References

Notice

This document has been prepared by Participants of Digital Health Revolution research program and is licensed under a Creative Commons Attribution-ShareAlike 4.0 International License.

Implementation or use of certain elements of this document may require licenses under third party intellectual property rights, including without limitation, patent rights. The Participants of and any other contributors to the Specification are not and shall not be held responsible in any manner for identifying or failing to identify any or all such third party intellectual property rights. This Specification is provided "AS IS", and no Participant makes any warranty of any kind, expressed or implied, including any implied warranties of merchantability, non-infringement of third party intellectual property rights, and fitness for a particular purpose.

MyData Architecture defines the operations and APIs between the Operational Roles (Operator, Source, Sink etc.). Any descriptions or figures of the roles' internal structure or operations are for illustrative purposes only.

1. Introduction

This document specifies the minimum service and data description structures for MyData Services and Operator configuration. It replaces the earlier 'MyData Service Registry' specification.

This document is part of the MyData Architecture Framework release 2.0. The reader is assumed to be familiar with the 'MyData Architecture Framework' document and with the parallel technical specification documents available at

https://github.com/mydata-sdk/mydata-docs/tree/master/architecture_specs_.

1.1 Notational Conventions

The keywords "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC2119].

1.2 Terminology

Key terminology used in this specification is defined in the Glossary of MyData Architecture Framework release 2.0 available at https://github.com/mydata-sdk/mydata-docs/tree/master/architecture_specs.

1.3 Formats

In MyData Architecture, all data records and their respective digital signatures exchanged between actors are expressed using Javascript Object Notation (JSON). Digital signatures are expressed as JSON Web Signature (JWS) structures and cryptographic keys as JSON Web Key (JWK) structures.

In this document, JSON definitions of the data records are presented without JWS structures. All Timestamps are in UTC in the NumericDate format as defined in [RFC7519].

2. Service Description

Services MUST provide information on their configuration and MyData endpoint locations. Depending on the service type and supported use cases the service description consists of a common part, data description part, processing purposes part, processing part and notification part.

Depending on the service registration model this data is either provided from a central service registry or from the service itself. If the service is providing the information by itself, it MUST use specified .well-known/mydata/ endpoint - for using .well-known URIs see [RFC5785]. Structure of this endpoint is defined in https://github.com/mydata-sdk/mydata-docs/tree/master/api_specs. Discovery of self-declared services is out of scope of this specification.

2.1 Common Service Description

Each service MUST provide basic information, such as data controller details and access URLs. Service Description object consists of unique serviceId and serviceDescription object.

Table 1: Common Service Description

KEY	ТҮРЕ	DESCRIPTION		
serviceId	String	Unique ID for the service		
serviceDescription	Object	See table 2		
dataDescription	Array	Array containing Data Description objects (see 2.2)		
processingBases	Array	Array containing Processing De	scription objects (see 2.3)	
		KEY	DESCRIPTION	
		contract	Array containing Processing Description objects for contract based processing	
		consent	Array containing Processing Description objects for consent based processing	
		publicInterest	Array containing Processing Description objects for public interest based processing	

		legitimateInterest	Array containing Processing Description objects for legitimate interest based processing
		vitalInterest	Array containing Processing Description objects for vital interest based processing
issued	String	When entry was created (system	log data)
createdByUserId	String	User Id	

Table 2: Service Description object

KEY	ТҮРЕ	DESCRIPTION			
serviceProvider	Object	See table 3			
serviceDescriptionT itle	String	Service's commercial/official title			
serviceIconURL	String	URL pointing to service's icon	1		
description	Array of				
	objects	KEY	TYPE	VALUE	
		language	String	Language used in information, ISO 639-1 coded	
		humanReadableDescription	String	Description of the service	
		keywords	Array of strings	List of keywords describing the service	
serviceDescriptionV ersion	String	Service description version nu	mber		
supportedProfiles	Array of strings	Profiles supported: "contract, ontification, objection"	consenting,	3rd party re-use,	

compatibleServices	Array of strings	Compati	ible servic	e's IDs		
cert	Object	IZENZ	TEXADE	DEG	CDIDTIC	
		KEY	ТҮРЕ	DES	CRIPTIO	DIN .
		x5u	String	URL certif		to service's x.509
serviceUrls	Object	Object d	lescribing	service	URLs	
		KEY			TYPE	DESCRIPTION
		domair	1		String	Service's domain (https://host:port)
		library	Domain		String	Services's MyData integration library domain (https://host:port)
		linking	Uri		String	URI for service linking
		linking	RedirectU	ri	String	URI user should be redirected after service has been linked. Used in service linking starting from the service.
		objection	onUri		String	URI for data processing objection
		notifica	ntionUri		String	URI for subscribing notifications

Table 3: Service Provider object

KEY	DESCRIPTION	VALUE
businessId	String	Service's business ID, e.g. VAT number

name	String	Name of the service
address1	String	Service's address
address2	String	Service's address
postalCode	String	Service's postal code
city	String	City where service is located
state	String	State where service is located
country	String	Country where service is located
email	String	Service's contact email
telephone	String	Service's contact telephone number
jurisdiction	String	Jurisdiction the service operates under

Service Description MAY be signed with the service's private key as defined in [RFC7515]. The JWS header MUST contain 'kid' field identifying services's key pair used to sign the Service Description.

2.2 Data Description

Each service processing or providing data (i.e. source) MUST describe the datasets it processes. Source service lists also datasets they can provide, and the API endpoint (distribution point). For clarification, a service does not need to describe data location if it uses data only internally i.e. it doesn't offer a related API for external use.

Table 4: Data description

KEY	ТҮРЕ	DESCRIPTION		
datasetId	String	Dataset's ID		
description	Array of	Objects describing da	ataset.	
	objects	KEY	TYPE	VALUE
		language	String	Language used in information, ISO 639-1 coded
		title	String	title

		description	String	Description of the dataset
		keyword	Array of str	rings Keywords describing dataset
datasetSchema	Object	Object describing	g dataset's schem	na
		KEY	I	DESCRIPTION
		@context		SON-LD context for the lataset (optional)
		@type		SON-LD type for the lataset (optional)
		@id	J	SON-LD id for the dataset
url	String	URL pointing to schema (optional		on of the data, e.g. to JSON
distribution	Array of objects	Objects describin internal process	-	ution point. NOT used in
		distributionId	I	D for the distribution
		accessUrl	Ţ	JRL where data is available
		format	F	Format of the data

2.3 Processing Description

Each service processing data MUST describe the processing purposes and what data it uses for each purpose. Purposes refer to datasets using dataset's schema information. Each processing base ("contract", "consent", "publicInterest", "legitimateInterest", "vitalInterest") service uses is described using Processing Description described in table 3.

Table 5: Processing description

KEY 1	ГҮРЕ	DESCRIPTION
-------	------	-------------

purposeId	String	Purpose's Id, MUST be unique	within the service description		
description	Array	Array of description objects containing localised information about the purpose			
		KEY	VALUE		
		language	Language used in information, ISO 639-1 coded		
		descriptionUrl	URL pointing to information about the purpose		
		title	Purpose's human-readable title		
		description	Purpose's human-readable description		
		iconUrl	URL pointing to icon for the purpose		
requiredDatasets	Array of strings	IDs of the core datasets this pro provide a meaningful outcome, processing cannot fulfill its basi	i.e. without which the intended		
optionalDatasets	Array of strings	IDs of the datasets this processi permitted by data subject. Used processing bases			

2.5 Notification Description

Services supporting Notifications MUST describe what notifications they support.

Table 6: Notification description

KEY	TYPE	DESCRIPTI	ON	
notifications	Array	Array of notif	fication de	scription objects
	Notification Object	Object descri	bing notifi	cations user can subscribe
		KEY	ТҮРЕ	VALUE

id	String	Unique ID, used for	subscribin	g notification
description	Array of objects	KEY	ТҮРЕ	VALUE
		name	String	Notification's name (e.g. "Address Information", should pinpoint clearly what type of data has been processed)
		shortDescription	String	Short description
		longDescription	String	Long description
		url	String	URL pointing to notification description

3. Operator Configuration

Operator MUST provide information on its configuration and MyData endpoint locations. Operator MUST implement .well-known/mydata/operator endpoint. Structure of this endpoint is defined in https://github.com/mydata-sdk/mydata-docs/tree/master/architecture_specs Operator discovery is out of scope of this specification.

3.1 Operator Description

Table 7. Operator description

KEY	TYPE	DESCRIPTION			
operatorId	String	Unique ID for the operator			
serviceProvider	Object	See table 3			
operatorservicedesc riptionVersion	String	Operator service description version number			
supportedProfiles	Array of strings	List of profiles supported: possible values are "contract, consenting, 3rd party re-use, notification, objection"			
cert	Object		T		
		KEY	TYPE	DESCRIPTION	
		x5u String URL pointing to operator's X.509 certificate			
operatorUrls	Object	Object describing operator URIs			
		KEY		TYPE	DESCRIPTION
		domain		String	Operator Service's domain (https://host:port)
		linkingRedirectUri		String	URL user should be redirected after service has been linked. Used in service linking starting from the operator
createdOnDate	String	When the service description was created (system log)			
createdByUserId	String	User who created the service description (system log)			

Operator Description MAY be signed with the operator's private key as defined in [RFC7515].

The JWS header MUST contain 'kid' field identifying operator's key pair used to sign the Operator Description

4. Deployment Options

Service Descriptions can be provided from centralised source (Service Registry model, see earlier MyData Architecture releases) or the service can provide the information itself (decentralised model). Service must be registered to a service registry instance that serves the Operator's (or multiple Operators') registry services, if the Service Registry approach is used.

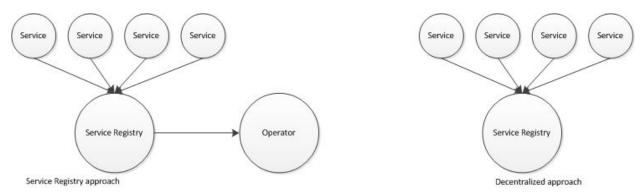

Figure 4.1 Centralised versus decentralised provisioning of service descriptions
